(a) k = 3, normal noise; curves differ mainly by their false-alarm rate
P(verdict = mismatch)
true gap, in run-to-run SDs
range overlap (Harbor)
mean ± SEM bars overlap
|gap| ≤ SE of difference
pooled t-test, p < .05
Welch t-test, p < .05
0.05
(b) false-alarm rate by k
false alarm: P(mismatch | perfect port)
runs per side k
range overlap
SEM bars overlap
pooled t-test
Welch t-test
(c) detection of a fixed 2 SD gap by k
P(detect a 2 SD gap)
runs per side k
range overlap
SEM bars overlap
pooled t-test
Welch t-test
(d) true gap fixed at 2 points, k = 3
probability (pass, or equivalence shown)
run-to-run SD, points (both sides)
range overlap: P(pass)
pooled t-test: P(no significant gap)
TOST ±3: P(equivalence shown)
observed SD quartiles
